

Vizbl Product Schedules

Version 2026-10-02.2

D AI Virtual Try On

This Schedule applies only where AI Virtual Try On is selected in the Order Form. The order identifies supported product categories and input modes, such as jewelry, watches, eyewear, hats, accessories or other expressly supported products. A category must not be assumed supported merely because it is named as an example here.

Scope and accuracy. The service generates or modifies an image to preview a selected product on a voluntarily supplied person image. Results are synthetic visual approximations and may contain artifacts or altered product details. The service does not guarantee actual fit, physical dimensions, size recommendation, color, likeness fidelity or product performance. Customer must not describe a generated image as an authentic photo of a real use or endorsement without a truthful basis and required permissions. Material consumer-facing claims require review.

Permitted images. Customer must provide a lawful basis and clear notices, and obtain permissions required for depicted persons and any publication. Shoppers may upload their own image; images of another adult require that person's authorization. The standard service is not directed to children and does not authorize uploading minors' images, intimate imagery, nonconsensual manipulation, impersonation, identity verification, surveillance or inference of sensitive traits.

Biometric boundary. This package does not authorize regulated biometric identification, biometric templates or regulated face/hand geometry processing. If the actual implementation creates biometric data regulated by applicable law, the affected feature must remain disabled until the parties adopt an appropriate signed addendum, required individual notice/consent and retention/deletion controls. Calling the input a photograph or not identifying a person does not itself resolve the legal classification of downstream processing.

Billable generation. Unless an expressly identified signed variation states otherwise, one billable generation is one requested output successfully produced and made available to the requesting user. Failed, blocked, timed-out or undelivered requests and Vizbl-initiated technical retries do not consume a paid generation; duplicate events are reversed. A fresh user-requested variation counts separately if successfully delivered. Multiple requested outputs count as the number delivered. A subjective dislike of an otherwise delivered output is not a technical failure; reproducible service errors are addressed under the Terms.

Commercial controls. Before signature, define allowance, period, any token-to-generation conversion, expiry/rollover and authorized overage rate and cap. A mere upload or widget opening is not a billable generation. At exhaustion without paid-overage authorization, generation pauses pending approval. No fixed rate or free trial is implied.

Privacy. Person images and person-specific outputs are private and processed only as described in the DPA. No model training, public gallery, marketing reuse or unrelated sensitive inference is authorized. Optional longer saving or sharing requires explicit documented scope, valid permissions and a defined retention period; it is not enabled by default.
